Appendix 2C Jurisdictional Delineation

Sunset Crossings Residential Project Initial Study October 27, 2022

JN 184659

HIGHPOINTE COMMUNITIES, INC. Attn: *Ross Yamaguchi* 530 Technology, Suite 100 Irvine, California 92618

SUBJECT:Delineation of State and Federal Jurisdictional Waters for the Sunset Crossing TTM38443 Project – City of Moreno Valley, County of Riverside, California

Dear Mr. Yamaguchi:

Michael Baker International (Michael Baker) has prepared this report to document the results of a literature review and formal delineation of State and federal jurisdictional waters, including wetlands, that was conducted for the proposed Sunset Crossing TTM 38443 Project (project or project site) located in the City of Moreno Valley, Riverside County, California. Specifically, the delineation was conducted to identify and document the extent of aquatic and other hydrologic features within the project site that potentially fall under the jurisdictional authority of the U.S. Army Corps of Engineers (USACE), the Regional Water Quality Control Board (RWQCB), and the California Department of Fish and Wildlife (CDFW). This report summarizes the methodology utilized throughout the course of the delineation, defines the jurisdictional authority of the regulatory agencies, and documents the findings made by Michael Baker. This report presents Michael Baker's determination of jurisdictional boundaries based on the most up-to-date regulations, written policy, and guidance approved by the regulatory agencies. However, please note that only the regulatory agencies can make a final determination of jurisdictional limits.

PROJECT LOCATION

The project site is located within the City of Moreno Valley, generally to the north of Alessandro Boulevard, east of Nason Street, south of Cottonwood Avenue, and west of Marion Road (refer to Figure 1, *Regional Vicinity*, provided in Attachment A). The project site is depicted in Section 10, Township 3 South, Range 3 West, on the U.S. Geological Survey's (USGS) *Sunnymead, California* 7.5-minute quadrangle map (refer to Figure 2, *Project Vicinity*). Specifically, the project site is located on assessor's parcel numbers (APN) 488-190-005, 488-190-027, and 488-190-028, and is bounded by Cottonwood Avenue to the north, residential development and Martha Crawford Street to the northeast, undeveloped land and Bay Avenue to the south, and residential development and Nason Street to the west (refer to Figure 3, *Project Site*).

PROJECT DESCRIPTION

The proposed project includes the development of up to 134 residential units, a water basin, a park, and road construction on 28.2 gross acres (23.1 net acres). Refer to Appendix A, Conceptual Site Plan.

STATE AND FEDERAL REGULATIONS

There are three key agencies that regulate activities within inland lakes, streams, wetlands, and riparian areas in California. The USACE regulates activities that result in the discharge of dredged or fill material into waters of the U.S. (WoUS), including wetlands, pursuant to Section 404 of the federal Clean Water Act (CWA) and Section 10 of the Rivers and Harbors Act. Of the State agencies, the RWQCB regulates discharges to waters of the State (WotS), including wetlands, pursuant to Section 401 of the CWA, Section 13263 of the California Porter-Cologne Water Quality Control Act (Porter-Cologne Act), and State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State; and, the CDFW regulates alterations to lakes, streambeds, and riparian habitats pursuant to Section 1600 *et seq.* of the California Fish and Game Code (CFGC).

LITERATURE REVIEW

Prior to conducting the field delineation, Michael Baker conducted a review of relevant literature and materials to obtain a general understanding of the environmental setting and preliminarily identify features/areas within the project site that may fall under the jurisdiction of the regulatory agencies. Refer to the subsections below for a summary of relevant materials, databases, technical reports, and guidance documents that were obtained/reviewed by Michael Baker. In addition, a complete list of references is provided as Attachment G to this report.

San Jacinto River Watershed

The project site is located within the Perris Valley Hydrologic Subarea 802.11 (HSA) of the Perris Hydrologic Area 802.10 (HA), which in turn is located within the San Jacinto Valley Hydrologic Unit (802.0) of the larger San Jacinto River Watershed (HUC 18070202). The San Jacinto River Watershed covers approximately 780 square miles within western Riverside County. Flows originate in Santa Rosa and the San Jacinto Mountains and form the San Jacinto River, which flows generally west until terminating at the lowest point within the watershed at Lake Elsinore. Tributaries to the San Jacinto River include Cottonwood Canyon Creek, Canyon Lake, Salt Creek, Perris Valley Channel, Bautista Creek, Indian Creek, North Forks San Jacinto River, Logan Creek, Stone Creek, Black Mountain Creek, Fuller Mill Creek, South Fork San Jacinto River, Dry Creek, Strawberry Creek, Coldwater Creek, Spillway Creek, Canyon Creek, Lake Hemet, Herkey Creek, Fobes Canyon Creek, Pipe Creek, Martinez Creek, Gold Shot Creek, and Penrod Canyon Creek.

<u>Soils</u>

According to the *Custom Soil Resources Report for Western Riverside Area, California* (U.S. Department of Agriculture [USDA] 2022a), the project site is underlain by two soil map units: HcC: Hanford coarse sandy loam, 2 to 8 percent slopes (HcC); and RaB3: Ramona sandy loam, 0 to 5 percent slopes, severely eroded (RaB3). Michael Baker also reviewed the *Hydric Soils List for California* (USDA 2022b) to preliminarily verify whether any of the soil map units listed above were classified as a "hydric soil" in the Western Riverside Area. According to the list, none of the soil map units listed to occur within the project site are listed as hydric.

National Wetlands Inventory

Based on a review of the U.S. Fish and Wildlife Service's (USFWS) National Wetlands Inventory (USFWS 2022), no riparian or wetland features mapped in the NWI directly overlay the project site. However, one feature is mapped immediately northeast of the project site and connects to Aquatic Feature 1 downstream; this wetland feature falls within the riverine system and is described as an intermittent streambed with a seasonally flooded water regime (R4SBC).

Flood Zone

Based on a review of the Federal Emergency Management Agency's (FEMA) National Flood Hazard Layer Viewer (FEMA 2022), the project site is located within Flood Insurance Rate Map (FIRM) Panel Number 06065C0770G. Specifically, the project site is located in Zone X and described as an area of minimal flood hazard (refer to Attachment C).

National Hydrography Dataset

Based on a review of the National Hydrography Dataset (NHD) Advanced Viewer (USGS 2022b), one ephemeral drainage enters the northeastern corner of the project site and flows generally south before continuing offsite. The upstream portion of this ephemeral feature immediately northeast of the project site appears to coincide with the offsite riverine feature mapped by the NWI (refer to Attachment D).

FIELD METHODOLOGY

Michael Baker wetland delineators Tom Millington and April Nakagawa conducted a jurisdictional delineation/field survey of the project site and an additional 50-foot buffer of survey area around the project site on April 12, 2022, using the most recent, agency approved methodology, to identify and map the extent of State and federal jurisdictional features (i.e., wetland and non-wetland WoUS, waters of the State, streambed, riparian vegetation) located within the boundaries of the project site. Based on the project's location, potential State and federal wetlands were delineated in accordance with the methods and guidance provided in the *Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region, Version*

2.0 (Arid West Regional Supplement; USACE 2008), and the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (State Water Resources Control Board 2019).

While in the field, jurisdictional features were recorded on an aerial photograph at a scale of 1'' = 120' using topographic contours and visible landmarks as guidelines. Data points were recorded in the field using a Garmin GPS Map 64 Global Positioning System (GPS) to identify specific widths and length of jurisdictional features and the location of any ordinary high water mark (OHWM) indicators, photograph points, soil pits, and other pertinent site characteristics. These data were then uploaded as a .shp file and confirmed/refined to ensure accuracy and consistency with hardcopy notes and aerial mapping completed in the field. Michael Baker then used ESRI ArcGIS Pro software to calculate the total acreage of jurisdictional features and prepare final project figures.

RESULTS

Non-Wetland Features

Two ephemeral drainage features, Aquatic Feature 1 (AF-1) and Aquatic Feature 2 (AF-2), were identified within the project site and survey area during the April 12, 2022 site visit (refer to Attachment E, *Site Photographs*).

Aquatic Feature 1

AF-1 collects/transports municipal stormwater from the adjacent residential development and surrounding foothills north of the project site, undergrounds beneath Cottonwood Avenue, and discharges into the northeastern corner of the project site and survey area via a corrugated concrete pipe culvert with concrete wingwalls. The offsite upstream portion of AF-1 appears to be the feature that has been mapped by both NWI and NHD. Flows drain south into a riprap-lined flood control channel which is confined by residential development on both banks. Approximately 360 linear feet downstream, AF-1 begins to transition from the riprap-lined flood control channel to an incised earthen channel. A small culvert with concrete wingwalls is located on the eastern bank in this transitional area. At the time of the site visit, the culvert was obstructed by sediment resulting in a small erosional rill. A minimal amount of saturated soil and surface water were noted in the immediate location of the obstructed culvert and rill on the eastern bank, but not within the main channel bed or the surrounding banks. No other standing or flowing water was observed in association with AF-1.

AF-1 continues south for approximately 180 linear feet and then begins to meander southwest towards the southern project boundary where it is no longer constrained by residential development on either bank. A large concrete retaining wall is located along the southern project site boundary and flows appear to be conveyed beneath this retaining wall, likely via a pipe or culvert; however, a significant amount of sediment deposition has occurred in the immediate vicinity of the retaining wall which reduces visibility. Additionally, a large debris-filled non-jurisdictional erosional rill occurs immediately northwest of where AF-1 flows beneath the retaining wall and exits the project site and survey area. AF-1 exhibited clear

evidence of hydrology and an OHWM ranging from 2 to 25 feet in width was observed via the following indicators: via a natural line impressed on the bank, change in particle size distribution, presence of a wrack line, and shelving.

The riprap-lined and soft-bottomed portions of AF-1 exhibited similar vegetation comprised of upland disturbance-tolerant non-native plant species consistent with the surrounding uplands; however, these species generally occurred in sparser patches within AF-1. Dominant species included foxtail barley (*Hordeum murinum*, FACU), foxtail brome (*Bromus rubens*, UPL), red stemmed filaree (*Erodium cicutarium*, UPL), ripgut brome (*Bromus diandrus*, UPL), sagebrush combseed (*Pectocarya linearis*, UPL), stinknet (*Oncosiphon piluliferum*, FACU), and summer mustard (*Hirschfeldia incana*, UPL). Additionally, a small amount of hydrophytic vegetation comprised of tall flatsedge (*Cyperus eragrostis*, FACW) and willowherb (*Epilobium ciliatum*, FACW) was observed in association with the obstructed culvert on the eastern bank. Within the project site and survey area, AF-1 measures a total of approximately 1,444 linear feet.

Aquatic Feature 2

AF-2 originates offsite as an ephemeral drainage which drains stormwater and other surface flows from the surrounding residential developments and foothills north of the project site; flows are conveyed south via a corrugated metal pipe underneath Cottonwood Avenue and enter the northwestern portion of the project site and survey area via a corrugated metal pipe with broken concrete wingwalls. AF-2 flows south for approximately 611 linear feet as an unmaintained ephemeral earthen drainage before transitioning to discontinuous unconfined/overland sheet flow which ultimately fans out and infiltrates on the northwestern potion of the project site. No standing or flowing surface water was observed within the AF-2 during the field survey. However, evidence of an OHWM ranging from 5 to 10 feet in width was observed via a natural line impressed on the bank, change in particle size distribution, presence of a wrack line, and shelving.

AF-2 exhibited the same upland vegetation as AF-1 with a predominance of ripgut brome and summer mustard and occasional patches of bare sandy soil. A patch of Peruvian pepper trees (*Schinus molle*, FACU) occurs in the northern portion of AF-2 in association with the residential development immediately to the west. Additionally, a small patch of mature mulefat (*Baccharis salicifolia*, FAC) occurs approximately 230 feet downstream of where AF-2 enters the project site and survey area.

Wetland Features

In order to confirm the presence/absence of wetlands within the project site and survey area, two soil pits (SP1 and SP2) were dug in areas where wetland hydrology or hydrophytic vegetation was observed. SP1 was located near the obstructed culvert in an area where urban runoff and stormwater from surrounding residential development collects/infiltrates within the project site. Plant species in this location included a mixture of the upland disturbance-tolerant non-native plant species and native hydrophytic vegetation including foxtail brome (UPL), ripgut brome (UPL), tree tobacco (*Nicotiana glauca*, FAC), stinknet (FACU), summer mustard (UPL), tall flatsedge (FACW), and willowherb (FACW). SP1 was excavated to a depth of approximately 24 inches. Soils exhibited a sandy texture and displayed a matrix color of 10YR

3/3 when moist. No redoximorphic features were observed. Due to the absence of hydric soils, it was determined that SP1 met two (hydrophytic vegetation and wetland hydrology) of the three required parameters, and thus did not qualify as a wetland (refer to Attachment F, *Wetland Determination Data Forms*).

SP2 was located within the AF-2 due to the presence of mulefat (FAC) and secondary hydrology indicators (i.e., sediment deposits and drift deposits). SP2 was excavated to a depth of approximately 16 inches. Soils exhibited a sandy texture and displayed a matrix color of 7.5YR 4/4 when moist with no redoximorphic features observed. Additionally, SP2 did not pass the Dominance Test or the FAC-Neutral Test for hydrophytic vegetation. Due to the absence hydrophytic vegetation and hydric soils, it was determined that SP2 only met one (hydrology) of the three required parameters, and thus did not qualify as a wetland (refer to Attachment F, *Wetland Determination Data Forms*).

FINDINGS

AF-1 occurs within the eastern portion of the project site and survey area and does not exhibit a surface hydrologic connection to any Relatively Permanent Water (RPW) or Traditionally Navigable Water (TNW). Flows from AF-1 continue south offsite and drain into a roadside ditch which runs easterly along the northern side of Alessandro Boulevard before emptying into a small concrete culvert. Flows from AF-1 are then conveyed onto the property south of Alessandro Boulevard via a concrete culvert where AF-1 then transitions to discontinuous unconfined/overland sheet flow which ultimately fans out and infiltrates offsite. Furthermore, AF-1 appears to be an ephemeral feature which flows only in direct response to precipitation. Therefore, AF-1 would not qualify as a WoUS and would not fall under the regulatory authority of the USACE. However, based on the results of the field delineation, AF-1 does comprise approximately 0.27 acre (1,444 linear feet) of RWQCB non-wetland waters of the State/CDFW vegetated streambed (consisting of 0.27 acre located within the project site and an additional <0.01 acre located within the survey area). Refer to Table 1 below and Figure 4, *Regional Board/CDFW Jurisdictional Map* provided in Attachment A).

AF-2 occurs within the northwestern portion of the project site and survey area and also does not exhibit a surface hydrologic connection to any RPW or TNW. Flows from AF-2 transition to discontinuous unconfined/overland sheet flow which ultimately fans out and infiltrates within the western portion of the project site. Furthermore, AF-2 appears to be an ephemeral feature which flows only in direct response to precipitation. Therefore, AF-2 would not qualify as a WoUS and would not fall under the regulatory authority of the USACE. However, based on the results of the field delineation, AF-2 does comprise a total of 0.10 acre (611 linear feet) of RWQCB non-wetland waters of the State/CDFW vegetated streambed (consisting of <0.001 acre located within the project site and an additional 0.10 acre located within the survey area), and approximately 0.02 acre of CDFW associated riparian (consisting of <0.01 acre located within the project site and an additional 0.02 acre located within the survey area).

CONCLUSIONS AND RECOMMENDATIONS

The USACE regulates discharge of dredged or fill material into WoUS pursuant to Section 404 of the CWA and Section 10 of the Rivers and Harbors Act. No USACE jurisdiction occurs in association with the project site, as neither AF-1 nor AF-2 exhibit any downstream surface connection (significant nexus) to a RPW or a TNW.

The RWQCB regulates discharges to surface waters pursuant to Section 401 of the CWA and Section 13263 of the California Porter-Cologne Water Quality Control Act. Based on a review of the conceptual site plan, approximately 0.37 acre of impacts to RWQCB jurisdiction (non-wetland WotS) are anticipated, comprised of 0.27 acre of permanent impacts within the project site, and 0.10 acre of temporary impacts within the survey area. Therefore, it would be necessary for the project proponent to obtain a Waste Discharge Requirement (WDR) from the RWQCB prior to impacts occurring within RWQCB jurisdictional areas.

The CDFW regulates alterations to lakes, streambeds, and riparian habitats pursuant to Section 1600 *et seq*. of the CFGC. Based on a review of the conceptual site plan, a total of 0.39 acre of impacts to CDFW jurisdiction are anticipated. Anticipated impacts consist of 0.27 acre of permanent impacts and 0.10 acre of temporary impacts to vegetated streambed, and <0.01 acre of permanent impacts and 0.02 acre of temporary impacts to associated riparian. Therefore, it would be necessary for the project proponent to obtain a Section 1602 Streambed Alteration Agreement (SAA) from the CDFW prior to impacts occurring within CDFW jurisdictional areas.

Please do not hesitate to contact me at (949) 472-3468 or <u>april.nakagawa@mbakerintl.com</u> should you have any questions or require further information.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

N/A Remarks:

Minimal amount of surface water visible underneath vegetation, but not in main flood control channel bottom or banks. Soil pit filled in with water to the top of the pit. Very small area approx 3ft x 3ft

U.S. Army Corps of Engineers WETLAND DETERMINATION DATA SHEET – Arid West Region See ERDC/EL TR-08-28; the proponent agency is CECW-CO-R

Are climatic / hydrolo	gic conditior	ns on the	site typical	for this time o	of year?	Yes	No	Х	(If no, expl	lain in Remarks.))
Are Vegetation	, Soil	, or Hydr	ology	significantly	disturbed?	Are "Norma	al Circum	stances	s" present?	Yes X	No
Are Vegetation	, Soil	, or Hydr	ology	naturally pro	blematic?	(If needed,	explain a	any ans	wers in Ren	narks.)	
SUMMARY OF F	INDINGS	5 – Attao	ch site m	ap showii	ng sampli	ng point	locatio	ons, tr	ansects,	important fe	atures, etc.

Hydrophytic Vegetation Present?	Yes	No <u>X</u>	Is the Sampled Area		
Hydric Soil Present?	Yes	No X	within a Wetland?	Yes	No X
Wetland Hydrology Present?	Yes X	No			

Remarks:

Significant drought conditions present. Cottonwood Avenue to north, vacant land that is routinely disked/maintained and dominated by various upland/non-native species to south and east, and residential development to east and west.

VEGETATION – Use scientific names of plants.
